

Personnel File Registry & Movement Tracking System

A web-based system to register staff files and track every check-out and return.

PREPARED FOR

[Client Organisation]

Human Resource Registry

1. Executive Summary

The Human Resource Registry of [Client Organisation] holds the personal file of every officer. These files move constantly: officers collect them for use elsewhere and return them later. Tracking this in paper registers is slow and error-prone, and it makes it hard to tell where a file is at any given moment.

[Your Company] proposes to deliver, deploy and support a **web-based Personnel File Registry and Movement Tracking System**. The system gives registry staff one place to register employees, record every file check-out and return, and find any file instantly by payroll number or name.

A working build of the core system already exists. This proposal covers hardening it for production, migrating existing records, deploying it on the Client's infrastructure, training staff, and providing ongoing support.

2. Background and Problem Statement

The registry currently manages personnel files with manual registers and shelf lists. This creates recurring problems:

- **Files are hard to find.** Nothing shows in real time who collected a file, when, or whether it has been returned.
- **Handovers aren't accountable.** The officer who collected, returned or received a file is not always recorded in a way that can be checked later.
- **Employee details are scattered.** Payroll number, job group, designation and terms of service are not held in one place linked to the file.
- **Reporting is slow.** Answering simple questions, such as how many files are currently out, means counting by hand.

3. Objectives

- Give every personnel file one digital record, linked to the officer's payroll number.
- Record every file check-out and return with names and dates.
- Let authorised staff find any file in seconds.
- Give management a live dashboard of registry activity.
- Restrict access by role and keep a record of who changed what.

4. Proposed Solution

The system is organised into modules that match how the registry already works:

Module	What it does
Employee Registry	Register officers with payroll number, name, job group, designation, date of birth, terms of service (permanent and pensionable, probation, temporary, local contract, supernumerary, ESP) and special-category flag. Age is calculated automatically.
File Movement	Record check-out of a Main or Temporary file: destination, collected by and date. Record the return: returned by, received by and date. Shows which files are currently out.
Unified Search	One search box across employees and file movements, searchable by payroll number or free text.
Dashboard & Statistics	Live totals: employees (active and total), files currently in movement, and users.
User Management	Create users, assign roles, change roles and deactivate accounts. Sign-in is secure and includes email-based password reset.

5. File Movement Flow

Each movement is recorded against the officer's payroll number. A file can go through this cycle any number of times.

6. System Architecture and Technology

The system is a modern three-tier web application. Staff use it from a standard browser; no software needs to be installed on their computers.

Layer	Technology	Role
User interface	React with TypeScript, Vite, Tailwind CSS and shadcn/ui	Responsive screens for each module, a dashboard, forms and search.
Application API	Node.js with Express 5	REST API for every module; checks input and applies business rules.
Database	MongoDB with Mongoose	Stores employee and file records. Indexed for fast text and payroll-number search.
Authentication	JSON Web Tokens in secure HTTP-only cookies; bcrypt password hashing	Signs users in, keeps sessions and protects passwords.
Notifications	Nodemailer (SMTP)	Password-reset emails with time-limited links.

Deployment options

- **On-premise:** installed on a server within the Client's own network. Recommended for personnel data.
- **Cloud / hosted:** hosted in a secure data centre that complies with the applicable data protection law.

7. Security and Access Control

Role	Typical access
Record Officer	Full access to registry operations and reports.
Clerk	Registers employees, records file check-outs and returns; searches records.
User	Searches and views records only.
DB-Admin	Manages users and roles, and runs backups and data maintenance.
Developer	Technical support access. Disabled in production except during support windows.

As part of production hardening, [Your Company] will:

- Require sign-in and check the user's role on **every** API endpoint, not only in the user interface.
- Add an audit trail that records who created or changed each record, and when.
- Enforce HTTPS, strict cross-origin rules, request limits and input validation.
- Set up automated daily database backups and test restoring from them.
- Handle personal data in line with the applicable data protection law.

8. Data Migration

Existing records will be loaded into the system in controlled batches:

- The Client provides employee lists and current movement registers as spreadsheets (CSV/Excel).
- [Your Company] cleans and checks the data (duplicate payroll numbers, missing dates of birth, invalid terms of service) and returns an exceptions report for the registry to resolve.
- Records are imported with the system's import tool and checked against sample counts that registry staff sign off.

9. Implementation Plan

Phase	Activities	Duration	Deliverables
1. Inception & requirements	Kick-off, review of registry procedures, confirmation of roles and reports	1 week	Inception report; confirmed requirements
2. Production hardening	Endpoint security, audit trail, validation, configurable settings, performance tuning	3 weeks	Hardened system; security checklist
3. Data migration	Cleaning, exception reports, batch imports, reconciliation	2 weeks	Migrated data; reconciliation report
4. Deployment	Server setup, HTTPS, backups, monitoring	1 week	Live system; deployment and backup guide
5. User acceptance testing	Registry staff test real scenarios; defects fixed	2 weeks	Signed UAT report
6. Training & go-live	Role-based training, user manuals, supported go-live	1 week	Trained users; user and admin manuals
7. Warranty support	Defect fixes and on-call support after go-live	3 months	Support log; handover report

Estimated time to go-live: about **10 weeks** from contract signing, followed by the warranty period.
 Durations will be confirmed at inception.

10. Training, Support and Maintenance

- **Training:** hands-on sessions for clerks and record officers, a separate session for administrators, and a train-the-trainer session so the Client can train staff itself.
- **Documentation:** a user manual for each role, an administrator guide, and backup and restore procedures.
- **Warranty:** three months of defect fixes at no extra cost after go-live.
- **Annual maintenance (optional):** security updates, backup monitoring, help desk during working hours, and minor enhancements under an agreed service level.

11. Expected Benefits

- Anyone with access can see where a file is and who has it.
- Every file handover records who collected, returned and received it.
- Files are found in seconds instead of by searching registers and shelves.
- Management reports are always up to date and need no manual counting.

12. Financial Proposal

All amounts are in Kenya Shillings (KES) and include all applicable taxes.

#	Item	Amount (KES)
1	Inception and requirements confirmation	80,000
2	System customisation and production hardening	500,000
3	Data cleaning and migration	250,000
4	Deployment, configuration and backups	200,000
5	Training and documentation	170,000
6	Three-month warranty support	Included
Total one-off cost		1,200,000

Payment schedule

Milestone	Share	Amount (KES)
On contract signing	30%	360,000
On completion of data migration	30%	360,000
On signed user acceptance and go-live	40%	480,000

13. Assumptions and Client Responsibilities

- The Client names a registry focal person to confirm requirements and sign off each phase.
- The Client provides existing records in digital form (CSV or Excel) or supports their capture.
- For on-premise deployment, the Client provides a server (or virtual machine) and network access; [Your Company] will supply the minimum specification.
- The Client provides an SMTP email account for password-reset emails.
- Registry staff are available for training and user acceptance testing on the agreed dates.
- Changes to scope after requirements are confirmed go through an agreed change request.

14. Acceptance

Signing below accepts this proposal, subject to a formal contract.
